

**Announcing  
the most childish  
idea in years.**

# A new kind of shelf that stacks.

## 9 of ours fit into the height of 7 of theirs.

Supreme calls it the Thin Line Conserv-a-file.

But you can call it shorty. Because our stacked filing units take up much less height than ordinary shelving. 9 of our tiers in about the same height as only 7 of theirs. And you can get 6 Thin Line tiers into every space where there's now an ordinary 4-drawer file.

The reason: Thin Line modules are ingeniously designed with almost childlike simplicity. Supreme succeeded in eliminating the lip, biggest space-waster in shelf filing. With no braces, with the dividers an integral part of the unit, Thin Line tiers actually grow stronger as they're stacked.

They go up easily. Come down easily for moving or rearranging offices.

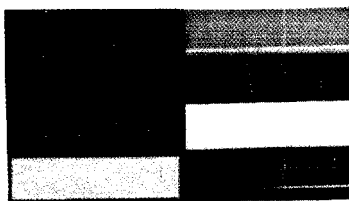

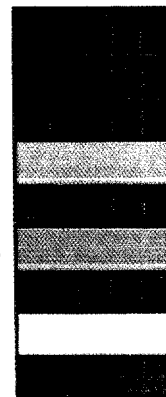

In this space-starved world we live in, when one great new idea like this comes along, it leads to another. Which is why Supreme will have the Thin Line with colorful doors (that double as

reference shelves).

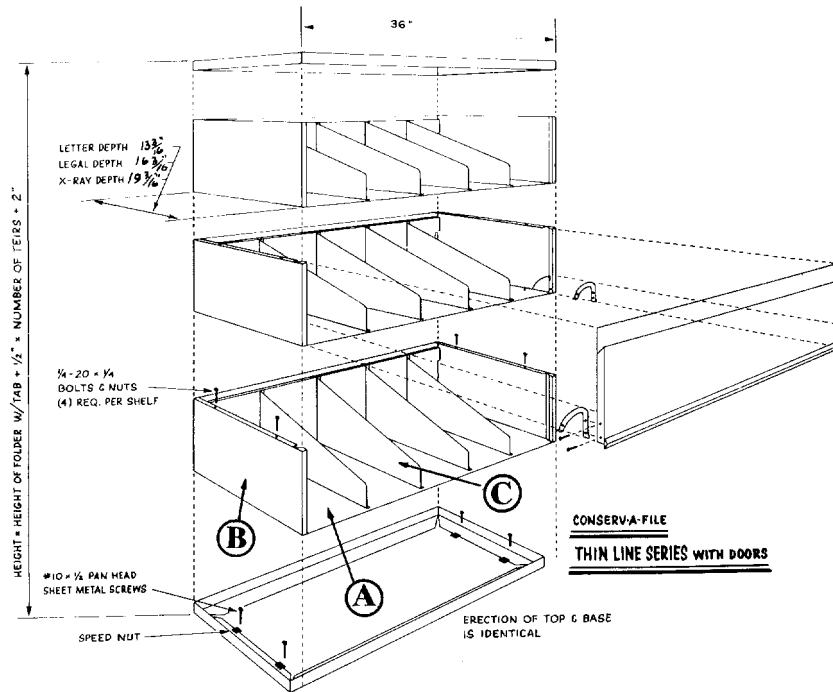

Now you know what to say when someone tries to sell you old fashioned fat shelves.

"Don't give me any of your lip."
